Assignment 2

Zalshaye

10/2/2021

R Markdown

This is the second homework assignment Use the bank data to create a k-NN Classification Load the packages that I will need and load in data set

```
library(readr)
library(caret)
## Warning: package 'caret' was built under R version 4.0.5
## Loading required package: lattice
## Loading required package: ggplot2
## Warning: package 'ggplot2' was built under R version 4.0.3
library(FNN)
library(gmodels)
library(dplyr)
##
## Attaching package: 'dplyr'
## The following objects are masked from 'package:stats':
##
      filter, lag
##
## The following objects are masked from 'package:base':
##
##
      intersect, setdiff, setequal, union
bank <- read csv('C:/Users/Z/Desktop/UniversalBank.csv')</pre>
##
## -- Column specification -------

```

The confusion matrix shows that the model is 96.0% accurate. This means that we predict correctly if the person accepts the personal loan 96% of the time. The model is 99.56% sensative, meaning we find a true acceptance of the loan 99.56% of the time. The precision was only 64.18%, meaning only 64.18% of what we predicted of who would accept the loan actually accepted the loan.

```
cl = as.factor(train1.norm.df$acceptance),
    k = 3, prob = TRUE) # 3 is what we found to be the best k

model1.2

```

The model is 96.2% accurate with a sensativity of 99.78%, we find a true acceptance of the loan 99.78% of the time. We get a precision of 59.55%, or 59.55% of the time we preidct somebody will get a personal loan they do.

The accuracy, sensativity and specificty of the model are the highest on the training data when compared to the validation and testing data. This makes sense given that the model is being trained on data that it sees in the training model and tested on data that it does not in the testing model. By being able to see the underlying data, we would expect the model to perform better than when it does out of sample.
